Office Action Summary

Application No.

10/692,063

Applicant(s)

DAVENPORT ET AL.

Examiner

ERNST ARNOLD

Art Unit

1613

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 2/28/11.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 25-38, 40-48, 50, 52 and 53 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 25-38, 40-48, 50, 52 and 53 is/are rejected.
- 7) ☒ Claim(s) 51 is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftperson's Patent Drawing Review (PTO-946)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB/08)
Paper No(s)/Mail Date _____
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 2/28/11 has been entered.

Claim '51' (a mis-numbering of claim 53) is new. Claims 1-24, 39, 49 and 51 have been cancelled. Claims 25-38, 40-48, 50, 52 and mis-numbered 53 are pending and under examination. Applicant's amendment has necessitated a new ground of rejection. Accordingly, this action is FINAL.

Withdrawn rejections:

Applicant's amendments and arguments filed 2/28/11 are acknowledged and have been fully considered. Any rejection and/or objection not specifically addressed below is herein withdrawn. Claim 50 was rejected under 35 U.S.C. 102(b) as being anticipated by Lewis, Lon (Feeding and Care of the Horse second edition; 1995, Blackwell Publishing Professional, Ames, Iowa). Applicant has amended the claim to overcome the rejection and it is withdrawn.

Claim Objections

The numbering of claims is not in accordance with 37 CFR 1.126 which requires the original numbering of the claims to be preserved throughout the prosecution. When claims are canceled, the remaining claims must not be renumbered. When new claims are presented, they

must be numbered consecutively beginning with the number next following the highest numbered claims previously presented (whether entered or not).

Misnumbered claim 51 been renumbered 53.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 25, 27-29, 32-34, 36, 38, 43 and 50 are rejected under 35 U.S.C. 102(b) as being anticipated by The American journal of obstetrics and diseases of women and children 1912, volume 66, W. Wood & Co., pp 893-894 as evidenced by Barth et al. (Nahrung 1997, 41(1): 2-12 Abstract only).

The Journal discloses methods of treating gastritis in an infant, hence providing critical care to a mammal with a digestive tract disease, with an inherently energy promoting effective amount of whey powder in water in an effective proportion of components (pages 893-894). No fat is present. Therefore, instant claims 25, 32, 33, 38 and 50 are anticipated. In other words, the that claimed subject matter has been known in the art for almost 100 years. Barth et al. disclose that whey contains protein with the highest biological value because of their amino acid composition. Barth et al. disclose that whey is rich in B-vitamins, such B-12, has a high nutrient density of calcium, beneficial ratios of Ca:P and Na:K and a high content of iodine (Abstract). Thus whey inherently has these vitamins and minerals and these are inherent in the method of the

Journal. Therefore instant claims 27, 29, 34, and 36 are anticipated. Since the composition is in solution then it inherently has dissolved liquid vitamins and anticipates instant claim 28. Since whey contains proteins and amino acids then the composition comprises at least one amino acid and claim 43 is anticipated.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 25-38, 40-48, 50, 52 and 53 remain/are rejected under 35 U.S.C. 103(a) as being unpatentable over Lewis, Lon (Feeding and Care of the Horse second edition; 1996, Lipponcort

Williams and Wilkins, Media, Pa) and Lewis, Lon (Equine Clinical Nutrition Feeding and Care; 1995, Williams & Wilkins, Media, Pa) and Parsons, HS., (Care and Management of the Older Horse; 2001, Trafalgar Square Publishing, North Pomfret, Vermont) and Weese et al. (Abstract; J. Am Vet. Med. Assoc 1999, 214(2), 229-32).

Applicant claims:

25. (currently amended) A method for reducing energy deficit in a mammal with an energy deficiency due to hepatic dysfunction, renal dysfunction, or digestive tract disease, comprising the step of enterically administering to the mammal an energy promoting effective amount of a composition having less than 3% fat comprising an effective proportion of components;

wherein the composition comprises a protein component comprising whey powder and lactase in the following approximate effective proportions: between about 95% and less than 100% by weight of whey powder, and between about 1% to about 5% by weight of lactase.

Determination of the scope and content of the prior art

(MPEP 2141.01)

In the feeding and care of the horse, Lewis provides chapters on Energy (chapter 1), Minerals (chapter 2), Vitamins (chapter 3), Harvested Feeds (chapter 4), Diet evaluation (Chapter 6), Horse Feeding Practice (chapter 8) and Feeding and Care of Horses with Health Problems (chapter 17) (page 4 of 14). Lewis teaches whey, which is what remains after milk proteins have been removed following drying, still contains 17-18% protein but is primarily lactose and is a source of protein for horses (page 88). It is the Examiner's position that dried

why is a powder in the absence of evidence to the contrary. Lewis teaches that horses over 3 years of age have little lactase which can be a problem for older horses who consume enough lactose to cause diarrhea (page 88). Lewis teaches that common horse feed contain 2-6% fat (page 18, right column). Thus feed supplements of 2% fat are known. Lewis teaches feeding and care of horses with health problems including **diarrhea** (a digestive tract condition) liver disease (hepatic dysfunction) and kidney failure (renal dysfunction) (chapter 17 title page). Thus, all of the instant disorders are covered in Lewis. Horses with **liver disease**, which reads on hepatic dysfunction, should be **tube fed**, hence enterally, with a diet that **meets energy needs, protein needs**, and be low in or not contain fat (page 296, left column). Lewis teaches that in **renal failure** a vitamin supplement is recommended to be added to the diet (page 296 Kidney Failure). Harvested feeds for horses include oats, **hay**, brewer's yeast, dried milk products, probiotics and bioflavonoids (chapter 4 title page). Vitamins include vitamins, A B1, B2, C, D, E, K, niacin, pantothenic acid, pyridoxine, biotin, floccain, cobalamin, and choline (chapter 3, title page). The composition has an effective proportion of components in the absence of evidence to the contrary. (Please note that the Examiner only had a limited preview of this book on Google books and could not access all the pages at this time.)

In equine clinical nutrition, Lewis (the same author of the feeding and care of the horse above) teaches that alfalfa is hay (page 16, right column). Lewis teaches that proteins are composed of **22 different amino acids** and feeds provide a sufficient amount of each amino acid (page 16, left column). Lewis teaches **minerals** for horses including sodium chloride salt, calcium, molybdenum, potassium, iron, copper, iodine, selenium, manganese and magnesium (chapter 2 title page). Vitamins are also taught (chapter 3, title page) as well as harvested feeds

for horses (chapter 4, title page). Sick horse feeding and nutritional support is taught which includes a section on **tube feeding** horses, horses with intestinal disorders, renal failure and hepatic dysfunction (chapter 17, title page). The horse with diarrhea can be feed by stomach tube (page 408, diarrhea). Microorganisms from yogurt or commercial inoculants can be administered (page 408, right column). Vitamin supplement for renal failure is recommended (page 413, left column). The composition has an effective proportion of components in the absence of evidence to the contrary.

Parsons teaches care and management of the older horse and adding a variety of supplements to the diet of the horse such as nutraceuticals such as chondroitin sulfate and glucosamine(which renders obvious other glucosamine derivatives) (title page, 88 and 89). Parsons teaches carbohydrates such as glucose and galactose as **monosaccharides** as energy supplying nutrients (Figure 1-3, page 10 of 10). Parsons teaches adding probiotics to horses with diarrhea and to avoid extra fat if the diarrhea is associated with liver disease (pages 210 and 211). Electrolytes can be administered by **stomach tube** (page 211). In liver disease, the vet may insist on **tube feeding** (page 235). A good quality vitamin supplement is recommended and fats and oils are to be kept to a minimum (page 237). In fact, Parsons teaches not to supplement your horse's normal feed with additional fat or oil but to **maintain adequate protein levels** and high in carbohydrates (page 236 to top of page 237). Carbohydrates include glucose and galactose monosaccharides as discussed above. The composition has an effective proportion of components in the absence of evidence to the contrary. Micronized materials are taught (page 237).

Weese et al. teach oral administration of lactase to a lactose intolerant foal (Abstract; J. Am Vet. Med. Assoc 1999, 214(2), 229-32). Thus, the concept of administration of lactase to lactose intolerant equines is established in the art.

Ascertainment of the difference between the prior art and the claims

(MPEP 2141.02)

1. The difference between the instant application and Lewis is that Lewis do not expressly teach adding between about 1 to 5 wt% lactase or that the whey powder is smaller than about 45 mesh to a composition that is liquid or powder form in a method for reducing energy deficit in a mammal with an energy deficit due to hepatic dysfunction, renal dysfunction or digestive tract condition. This deficiency in Lewis is cured by common sense and the teachings of Weese et al.

2. The difference between the instant application and Lewis is that Lewis do not expressly teach adding the nutrient component, feed component, amino acid chelate, trace mineral, monosaccharides, amino acids, and functional food component as instantly claimed to a human, dog, cow, pig, goat or sheep in a method for reducing energy deficit in a mammal with an energy deficit due to hepatic dysfunction, renal dysfunction or digestive tract condition. This deficiency in Lewis is cured by common sense and the teachings Parsons and Lewis (Equine Clinical Nutrition).

Finding of prima facie obviousness

Rational and Motivation (MPEP 2142-2143)

1. It would have been obvious to one of ordinary skill in the art at the time the claimed invention was made to add between about 1 to 5 wt% lactase, as suggested by common sense and Weese et al., to the composition of Lewis in liquid or powder form, or that the whey powder is smaller than about 45 mesh in a method for reducing energy deficit in a mammal with an energy deficit due to hepatic dysfunction, renal dysfunction or digestive tract condition and produce the instant invention.

One of ordinary skill in the art would have been motivated to do this because the textbook of Lewis clearly teaches that older horses lack lactase and a whey protein supplement rich in lactose can cause diarrhea. The artisan would add lactase to the composition to avoid causing diarrhea in the horse which can lead to dehydration and possibly death. Therefore, in order to avoid diarrhea it is common sense to add lactase to the diet as such a concept is already established by Weese et al. Regarding the amount of lactase, liquid or powder dosage form and the size of the whey powder, the amount of a specific ingredient in a composition, the dosage form of the composition and the size of particular ingredient are clearly a result effective parameters that a person of ordinary skill in the art would routinely optimize or can judiciously select. Optimization of parameters is a routine practice that would be obvious for a person of ordinary skill in the art to employ. It would have been customary for an artisan of ordinary skill to determine the optimal amount of each ingredient needed to achieve the desired results. Thus, absent some demonstration of unexpected results from the claimed parameters, the optimization of ingredient amounts would have been obvious at the time of applicant's invention. The expected and predictable result is reducing the energy deficit of the horse.

2. It would have been obvious to one of ordinary skill in the art at the time the claimed invention was made to add the nutrient component, feed component, amino acid chelate, trace mineral, monosaccharides, amino acids, liquid vitamin and functional food component as instantly claimed to a human, dog, cow, pig, goat or sheep, as suggested by the textbook of Lewis (Equine Clinical Nutrition), Parsons and common sense, in a method for reducing energy deficit in a mammal with an energy deficit due to hepatic dysfunction, renal dysfunction or digestive tract condition and produce the instant invention.

One of ordinary skill in the art would have been motivated to do this because the art directs one to add these components to treat sick horses. As taught by Lewis (Equine Clinical Nutrition), all the amino acids are contained in the protein supplements. The expected result remains decreasing the energy deficit in the horse. It is known by the references that such compositions decrease the energy deficit, hence provide energy and would be expected to work in any mammal capable of digesting the product. Furthermore, it is merely judicious selection of an amino acid chelate or liquid vitamin in the absence of evidence to the contrary. Applicant has not invented amino acid chelates. A vitamin dissolved in solution would be a liquid vitamin. The expected and predictable result is reducing the energy deficit of the horse.

In light of the forgoing discussion, the Examiner concludes that the subject matter defined by the instant claims would have been obvious within the meaning of 35 USC 103(a).

From the teachings of the references, it is apparent that one of ordinary skill in the art would have had a reasonable expectation of success in producing the claimed invention. Therefore, the invention as a whole was prima facie obvious to one of ordinary skill in the art at

the time the invention was made, as evidenced by the references, especially in the absence of evidence to the contrary.

Summary:

Equine clinical nutrition, feeding and care are well known in the art of equine care. Textbooks have been written for the artisan on the subject. Providing lactase to lactose intolerant equines is also known in the art of equine care. Therefore, supplementing an equine in need of supplementation due to digestive tract conditions, hepatic dysfunction and renal dysfunction to reduce the energy deficit in the equine with whey protein and lactase is obvious to the ordinary artisan in view of the cited references.

Response to Arguments:

Applicant asserts that Lewis, Lon (Feeding and Care of the Horse second edition; 1995, Blackwell Publishing Professional, Ames, Iowa) is not prior art. This argument is moot because the Examiner is applying the 1996 copyright date publication.

Applicant asserts that none of the references disclose or remotely suggest administering to a mammal with an energy deficiency due to hepatic dysfunction, renal dysfunction, or digestive tract disease a composition or feed program with less than 3% fat and whey powder. The Examiner strongly disagrees. Clearly hepatic dysfunction, renal dysfunction, and digestive tract disease are health problems and Lewis is directed to feeding and care of horses with health problems. Lewis clearly recognized the need for protein in the equine diet and suggests whey as a protein source. See discussion above. Applicant asserts that “the protein sources taught to be administered to a horse can still result in a horse that is protein starved.” This is just opinion.

From MPEP 716.01(c) II: The arguments of counsel cannot take the place of evidence in the record. In re Schulze, 346 F.2d 600, 602, 145 USPQ 716, 718 (CCPA 1965).

The facts are:

- whey is a known protein source for equines including sick equines and there is no art of record that directs the ordinary artisan not to supplement a sick equine with whey as a source of protein;
- diets with 2-6% fat are known in the art for equines;
- animals with decreased liver function should have a diet low in or not contain added fat; and
- it is known to add lactase to whey to counteract lactose intolerance.

The instantly claimed subject matter is nothing more than feeding a sick mammal a composition of whey protein that is low in fat. In view of the art of record, it requires no inventive skill to feed a sick mammal, such as a horse, whey protein that is low in fat. In view of the art of record, it requires no inventive skill to feed a sick mammal, such as a horse, whey protein and lactase to avoid intestinal distress in horse while supplying a protein source because it is known that older horses do not have the enzyme to metabolize the lactose in whey. Thus it becomes merely judicious selection of known ingredients to feed the mammal to provide energy in the absence of evidence to the contrary. Applicant has not supplied that evidence.

The principles of law state:

1. From MPEP 2141 I: "When considering obviousness of a combination of known elements, the operative question is thus "whether the improvement is more than

the predictable use of prior art elements according to their established functions.”

Id. at ___, 82 USPQ2d at 1396.”

2. From MPEP 716.02(a): “Evidence of a greater than expected result may also be shown by demonstrating an effect which is greater than the sum of each of the effects taken separately (i.e., demonstrating “synergism”). *Merck & Co. Inc. v. Biocraft Laboratories Inc.*, 874 F.2d 804, 10 USPQ2d 1843 (Fed. Cir.), cert. denied, 493 U.S. 975 (1989). However, a greater than additive effect is not necessarily sufficient to overcome a prima facie case of obviousness because such an effect can either be expected or unexpected. Applicants must further show that the results were greater than those which would have been expected from the prior art to an unobvious extent, and that the results are of a significant, practical advantage. *Ex parte The NutraSweet Co.*, 19 USPQ2d 1586 (Bd. Pat. App. & Inter. 1991).”
3. From MPEP 716.01(c) I: See, for example, *In re De Blauwe*, 736 F.2d 699, 705, 222 USPQ 191, 196 (Fed. Cir. 1984) (“It is well settled that unexpected results must be established by factual evidence.” “[A]ppellants have not presented any experimental data showing that prior heat-shrinkable articles split. Due to the absence of tests comparing appellant’s heat shrinkable articles with those of the closest prior art, we conclude that appellant’s assertions of unexpected results constitute mere argument.”). See also *In re Lindner*, 457 F.2d 506, 508, 173 USPQ 356, 358 (CCPA 1972); *Ex parte George*, 21 USPQ2d 1058 (Bd. Pat. App. & Inter. 1991).

This rejection is based on the well established proposition of patent law that no invention resides in combining old ingredients of known properties where the results obtained thereby are no more than the additive effect of the ingredients, *In re Sussman*, 1943 C.D. 518. Each component functions as on of ordinary skill in the art would expect it to function with predictable and expected effects. In other words, the combination of ingredients does no more than they would in separate sequential doses. In other words, Applicant's composition does not do anything unexpected in the method. Feeding a mammal whey protein is expected to reduce the energy deficit in the mammal because whey protein inherently contains calories, hence energy, for the mammal. This is common sense.

From MPEP 2143 A: "...all the claimed elements were known in the prior art and one skilled in the art could have combined the elements as claimed by known methods with no change in their respective functions, and the combination yielded nothing more than predictable results to one of ordinary skill in the art. *KSR*, 550 U.S. at ___, 82 USPQ2d at 1395; *Sakraida v. AG Pro, Inc.*, 425 U.S. 273, 282, 189 USPQ 449, 453 (1976); *Anderson 's-Black Rock, Inc. v. Pavement Salvage Co.*, 396 U.S. 57, 62-63, 163 USPQ 673, 675 (1969); *Great Atlantic & P. Tea Co. v. Supermarket Equipment Corp.*, 340 U.S. 147, 152, 87 USPQ 303, 306 (1950)."

Respectfully, these arguments are not persuasive, no unexpected results have been shown and synergy has not been argued. The claims remain rejected for at least these reasons and the reasons of record.

Conclusion

No claims are allowed.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to ERNST V. ARNOLD whose telephone number is (571)272-8509. The examiner can normally be reached on M-F 7:15-4:45.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Brian Kwon can be reached on 571-272-0581. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
